# Quick overview

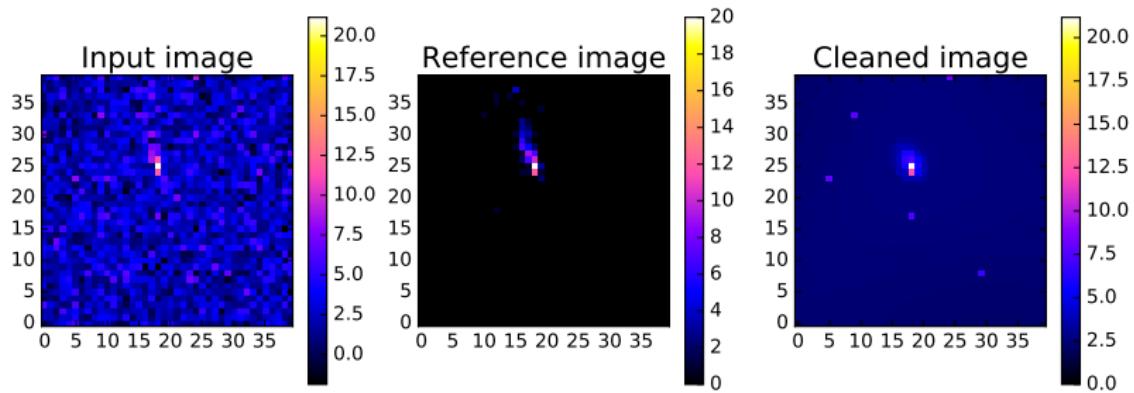

Reminder of the main issue: background &gt; 0 with Wavelets

Look at the scale of the cleaned image...

Reminder of the main issue: background &gt; 0 with Wavelets

It's more obvious with 'vmin=0' in matplotlib...

Reminder of the main issue: background &gt; 0 with Wavelets

- ▶ It explains the shift on all plots for WT
- ▶ It should explain why the classification works despite that mistake (the background is ignored by the classifier)

# Solution

# Solution

- ▶ Remove the largest plane in the wavelet space
- ▶ I took advantage of this to switch from mrtransform to mrfILTER (both are part of Cosmostat's Sparce 2D suite)
- ▶ MrfILTER advantages:
  - ▶ has more options to solve the background issue, remove isolated pixels, handle negative values, ...
  - ▶ has more options for filtering and handle more complex wavelets reconstruction
  - ▶ should be faster

# MrFilter

Used options:

- ▶ K Suppress the last scale (to have background pixels = 0)
- ▶ k Suppress isolated pixels in the support
- ▶ C1 Coef Detection Method: K-SigmaNoise Threshold
- ▶ s3 K-SigmaNoise Threshold = 3 sigma
- ▶ m3 Noise model (m10 works better but is much slower)...

## Benchmark function

The error function  $\mathcal{E}$  is given by:

$$\mathcal{E}(\hat{\mathbf{s}}, \mathbf{s}^*) = (\mathcal{E}_1(\hat{\mathbf{s}}, \mathbf{s}^*), \mathcal{E}_2(\hat{\mathbf{s}}, \mathbf{s}^*))^T$$

$$\mathcal{E}_1(\hat{\mathbf{s}}, \mathbf{s}^*) = \text{mean} \left( \text{abs} \left( \frac{\hat{\mathbf{s}}}{\sum_i \hat{\mathbf{s}}_i} - \frac{\mathbf{s}^*}{\sum_i \mathbf{s}^{*i}} \right) \right)$$

$$\mathcal{E}_2(\hat{\mathbf{s}}, \mathbf{s}^*) = \frac{\text{abs} (\sum_i \hat{\mathbf{s}}_i - \sum_i \mathbf{s}^{*i})}{\sum_i \mathbf{s}^{*i}}$$

Where:

- ▶  $\hat{\mathbf{s}}$  is the output image (the "cleaned" image)  $\in \mathbb{R}^d$
- ▶  $\mathbf{s}^*$  is the reference image (the "clean" image)  $\in \mathbb{R}^d$
- ▶  $i$  is the index of a PMT (i.e. of a pixel) within an image

Gammas

# Gammas

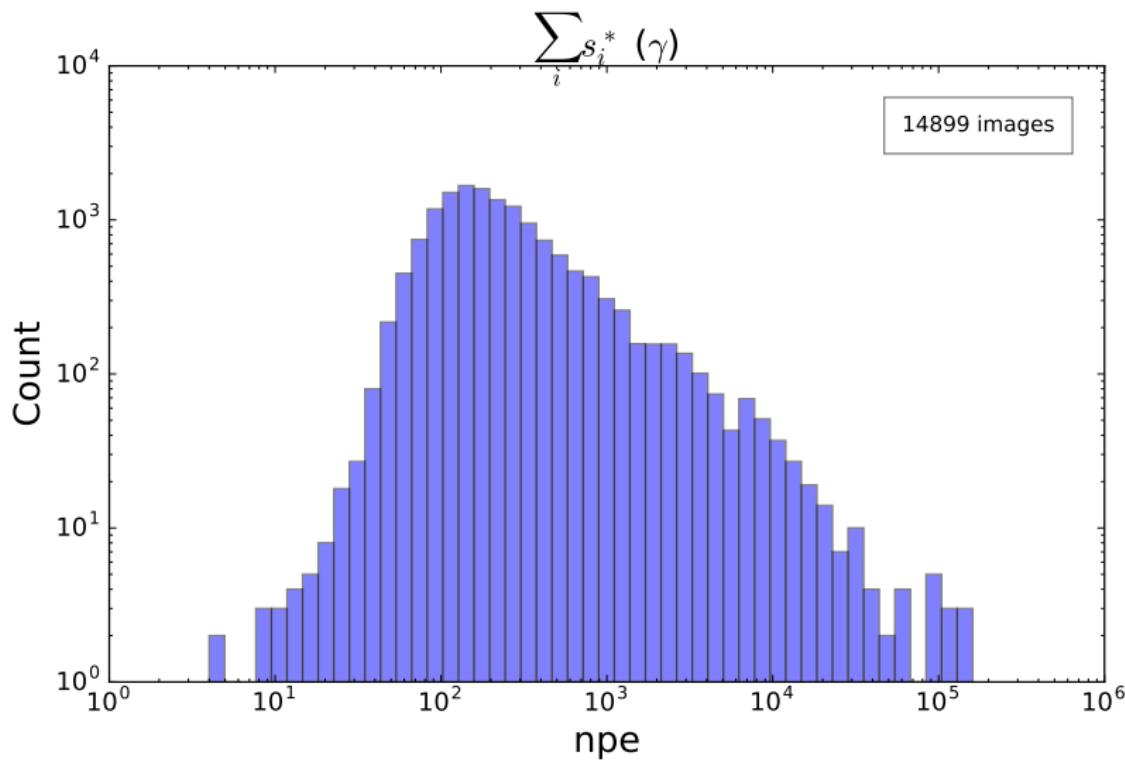

## Gammas

- ▶ ASTRI mini-array (calibrated data)
- ▶ Telescopes 1 to 33 only (ASTRI)
- ▶ Polychromatic event set
- ▶ Input files: sapcta:/dsm/manip/cta/DATA/astri\_mini\_array/fits/gamma/
- ▶ Source file:  
sapcta:/dsm/manip/cta/DATA/astri\_mini\_array/gamma/run1001.simtel.gz
- ▶ Num samples: 14899 images

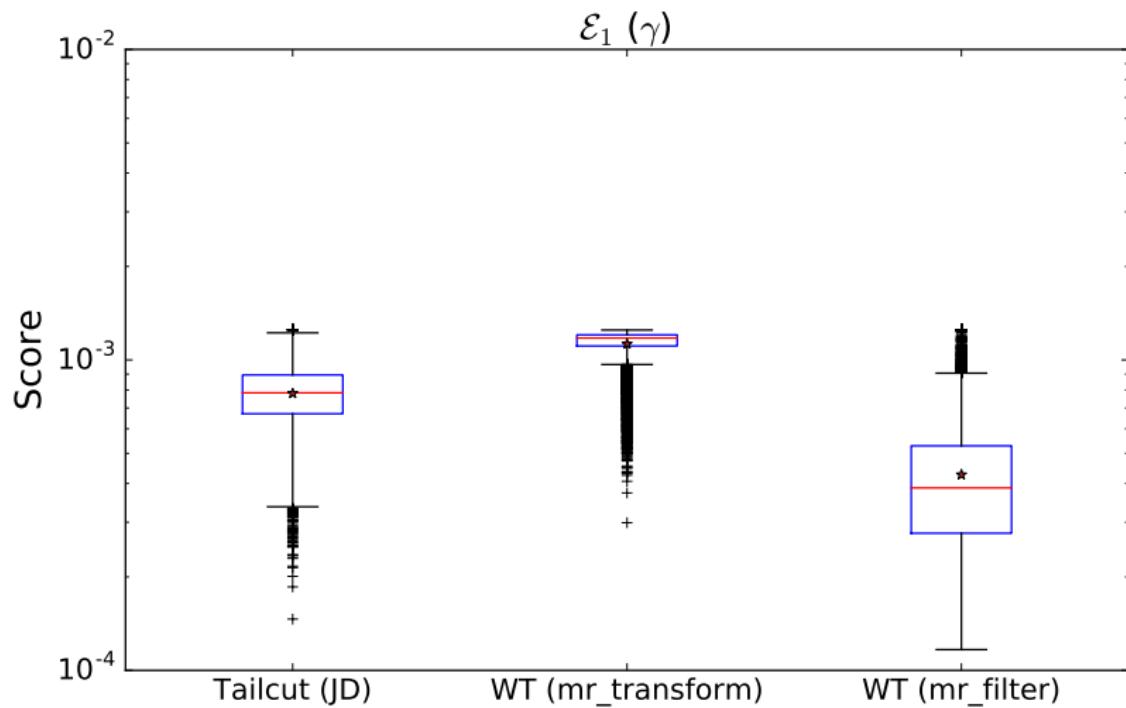

Cleaning algorithms:

- ▶ Tailcut: JD's implementation
- ▶ FFT: Numpy implementation
- ▶ Wavelets: Cosmostat Sparce2D (mr\_transform) b-Spline wavelet transform

# Energy conservation

# Definition

# Definition

The error on energy is given by:

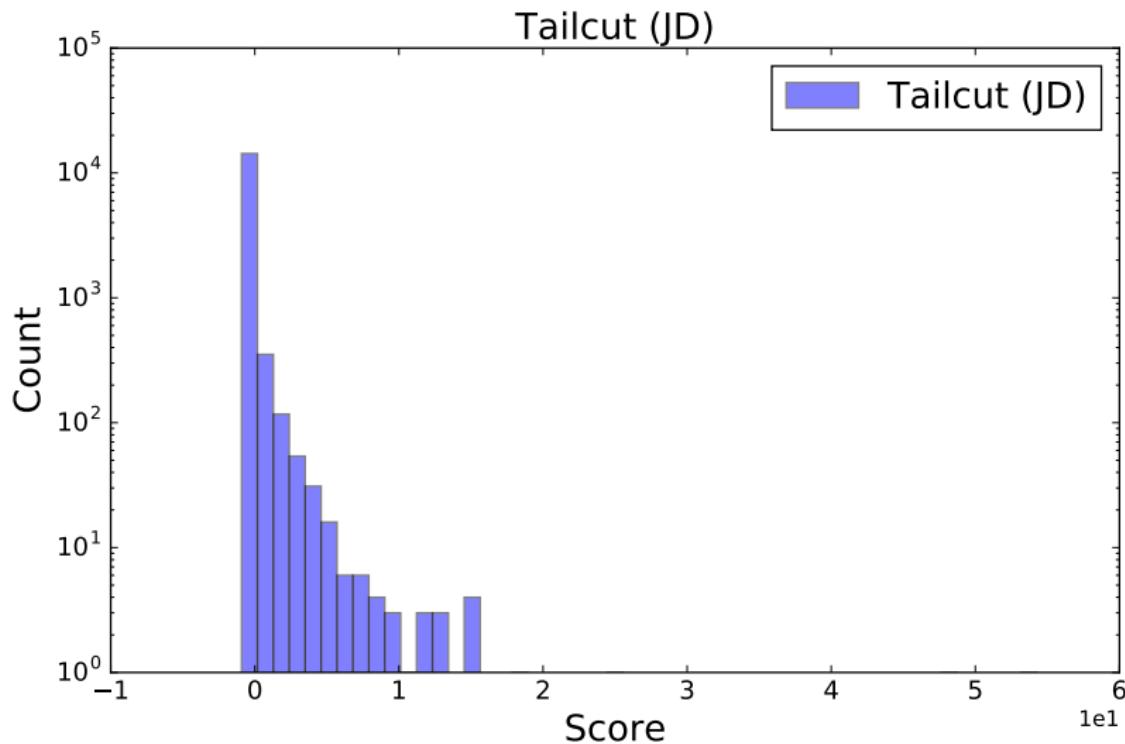

$$\frac{\sum_i \hat{s}_i - \sum_i s^*_i}{\sum_i s^*_i}$$

Where:

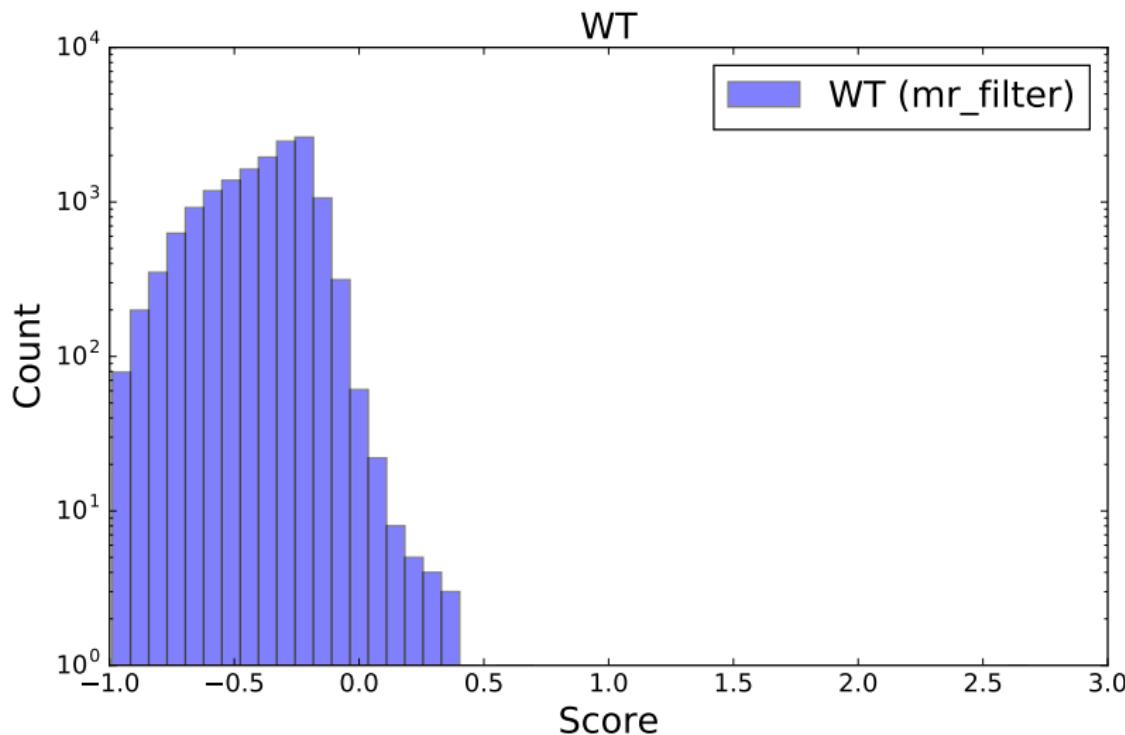

- ▶  $\hat{s}$  is the output image (the "cleaned" image)  $\in \mathbb{R}^d$
- ▶  $s^*$  is the reference image (the "clean" image)  $\in \mathbb{R}^d$
- ▶  $i$  is the index of a PMT (i.e. of a pixel) within an image

# Conclusion

# TODO

# TODO

- ▶ use the ctapipe implementation for Tailcut (work in progress)
- ▶ add metadata into input FITS files ( $E_{MC}$ , ...) (work in progress)
- ▶ use these metadata to plot  $\log(E_{MC})$  vs  $N_{pe}$ , score vs  $\log(E_{MC})$ , ... (almost done)
- ▶ plot the  $\chi^2$
- ▶ tag images where the signal is on the border
- ▶ optimize meta parameters (multicriteria optimization) (work in progress)
